

7 Misconceptions of Enterprise Agile

August 15

Misconception #1

Enterprise Agile will free you from having
to do requirements

Misconception #1

Enterprise Agile doesn't mean a total departure from requirements. Critical discovery and scoping are still required.

Misconception #1

Solution: Modernize how you do requirements:

- ✓ Business Analysts provide just enough detail (and no less) to establish the scope and business needs up front
- ✓ Defer the remaining detail for later construction iterations.

Blueprint:

Modernize your requirements process

PR146392: On ...										
PR146392: Online Store V1										
Name	ID	Description	Artifact Type	Icons	Iteration	Risk	Cost	Status		
Customer	AC146395	Represents all visitors to our site who come to browse and purchase merchandise.	Actor							
▶ Register	PF147153		Folder							
▶ Authenticate	PF147154		Folder							
▲ Profile	PF147155		Folder							
○ Manage Profile	UC146398	Management of the customer's individual, personal profile as held by the online store system.	Use Case		Iteration 3	3 - High	2 - Mid	Ready for review		
Profile	UM146423	Screen used to display the personal profile	UI Mockup							
Change Profile	UM146432	Screen used by the customer to make modifications to their personal profile.	UI Mockup							
Change profile scenario	SB147271	Storyboard depicting the scenario of a customer changing their profile.	Storyboard							
▲ Shipping	PF147142		Folder							
Shipping System	AC146435		Actor							
Shipping State Diagram	GD147265	The main states of product shipment and the transitions between them including triggering events.	Generic Diagram							
○ Ship	UC146403		Use Case		Iteration 2	1 - Low	1 - Low	Ready for dev		
Shipping Option	UM146414		UI Mockup							
Shipping Address	UM146413		UI Mockup							
Feedback from carrier	UM146443		UI Mockup							
Ship Books	UM146442		UI Mockup							
▶ Warehousing	PF147143		Folder							
▶ Accounting	PF147144		Folder							

Misconception #2

Once upon a time...

You can define business needs with
well-defined user stories

Misconception #2

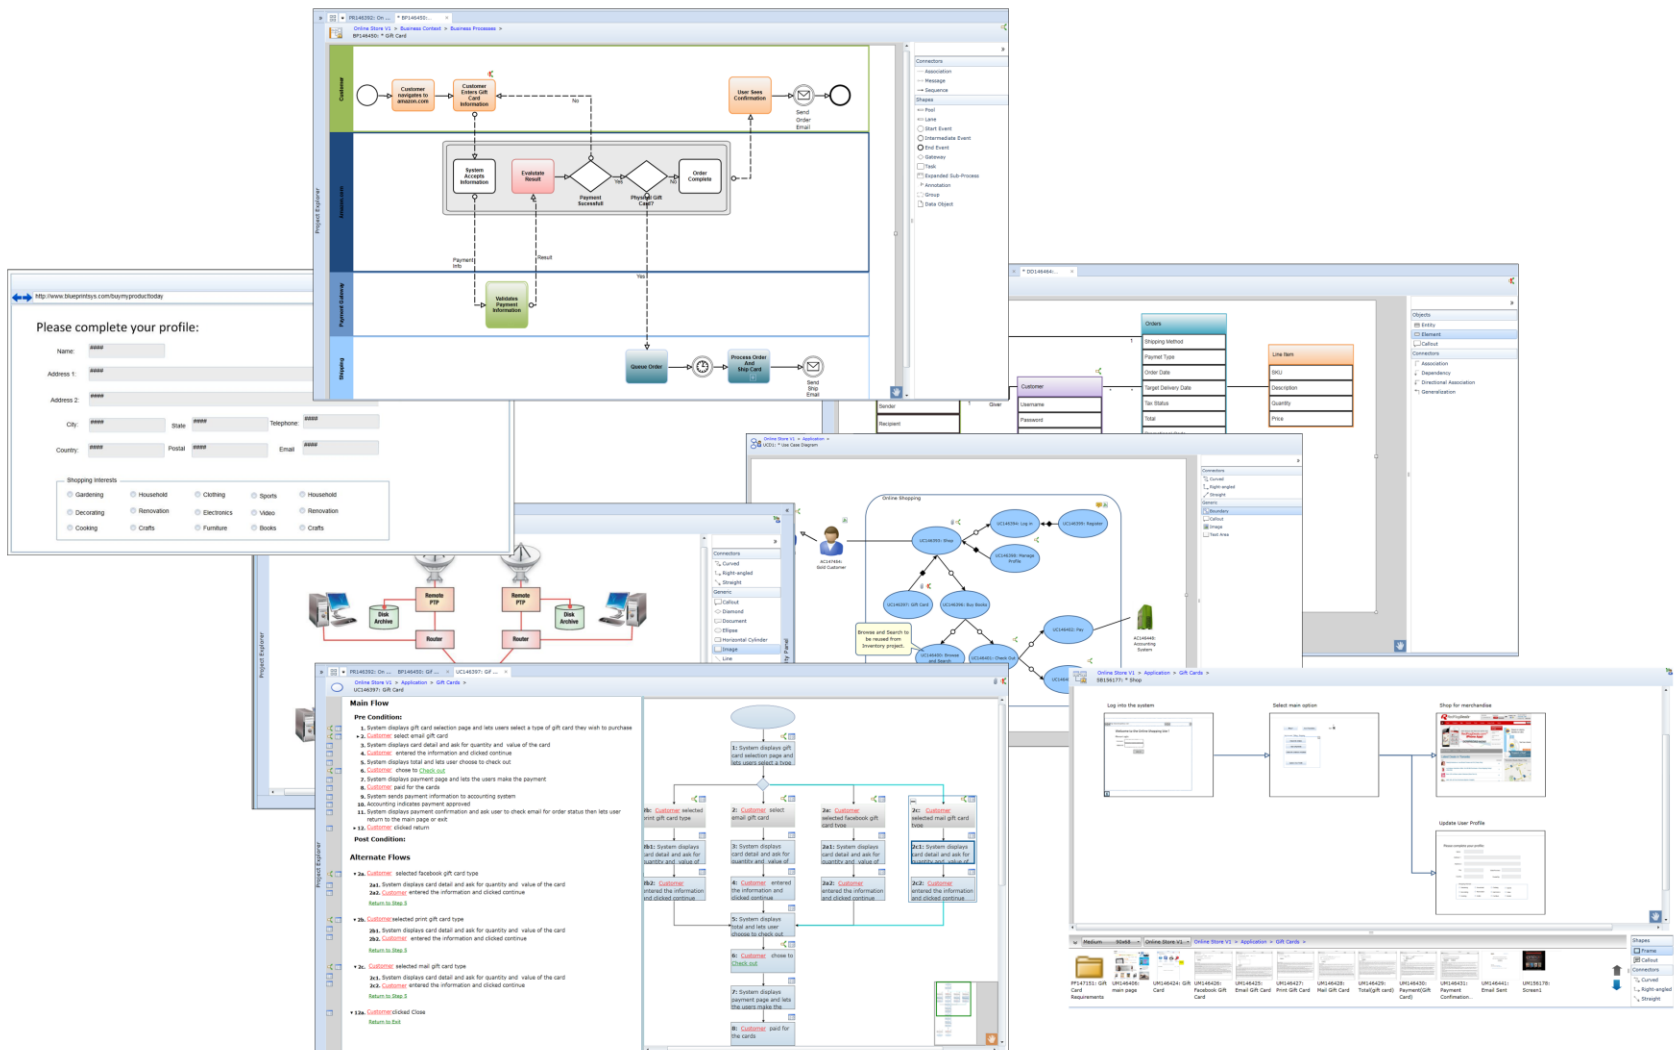

User stories are limited in their ability to provide both ‘big picture’ and granular details that many business stakeholders require.

Misconception #2

Solution: A requirements platform that provides necessary visibility and abstraction:

- ✓ Boost understanding of the application across the enterprise
- ✓ Boost understanding of the application for people who maintain, operate and support the application.

Misconception #3

User stories alone are adequate to support compliance and audit

Misconception #3

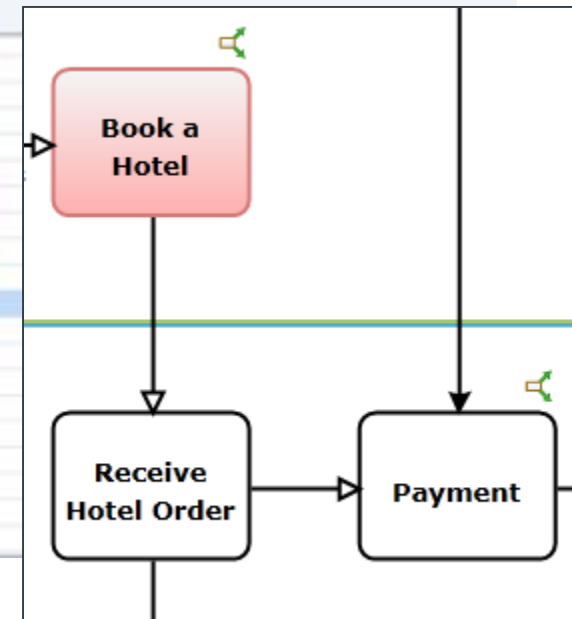

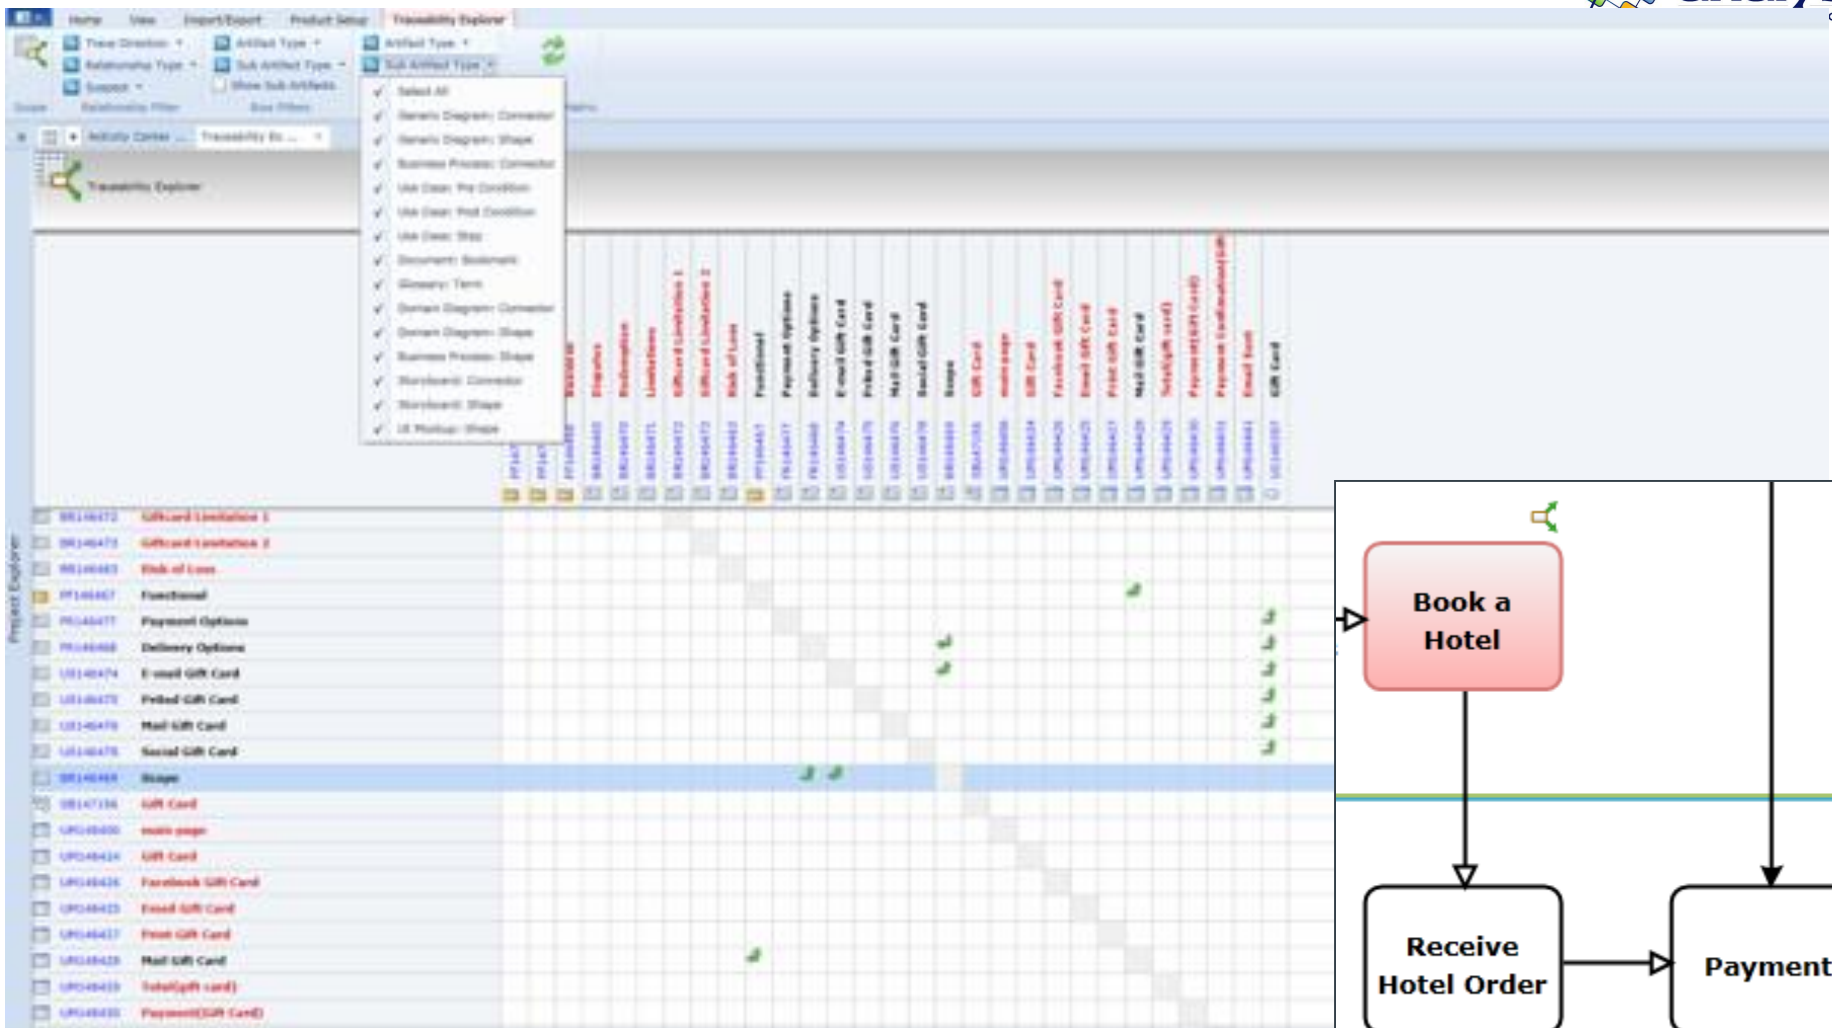

User stories alone add little value to the enterprise's ability to meet audit and compliance requirements.

Misconception #3

Solution: Requirements technology that delivers automated traceability and auditability:

- ✓ Ensure proof of compliance at every stage of the project
- ✓ Provide an easily accessible archive of ALL work.

Example: Managed Dependencies

Misconception #4

Enterprise Agile will drastically change
the way you do business

Misconception #4

Most management decisions are the same in Enterprise Agile as they would be using traditional approaches.

Misconception #4

Enterprise Agile will drastically change the way you do business.

So what has changed?

- Each level of management will simply use different data to make the same decisions.

For example a project manager needing to report project status may use...

- *Traditional: Work Breakdown Structure*
- *Agile: Product Backlog Burn-up or Release Burn-down Charts*

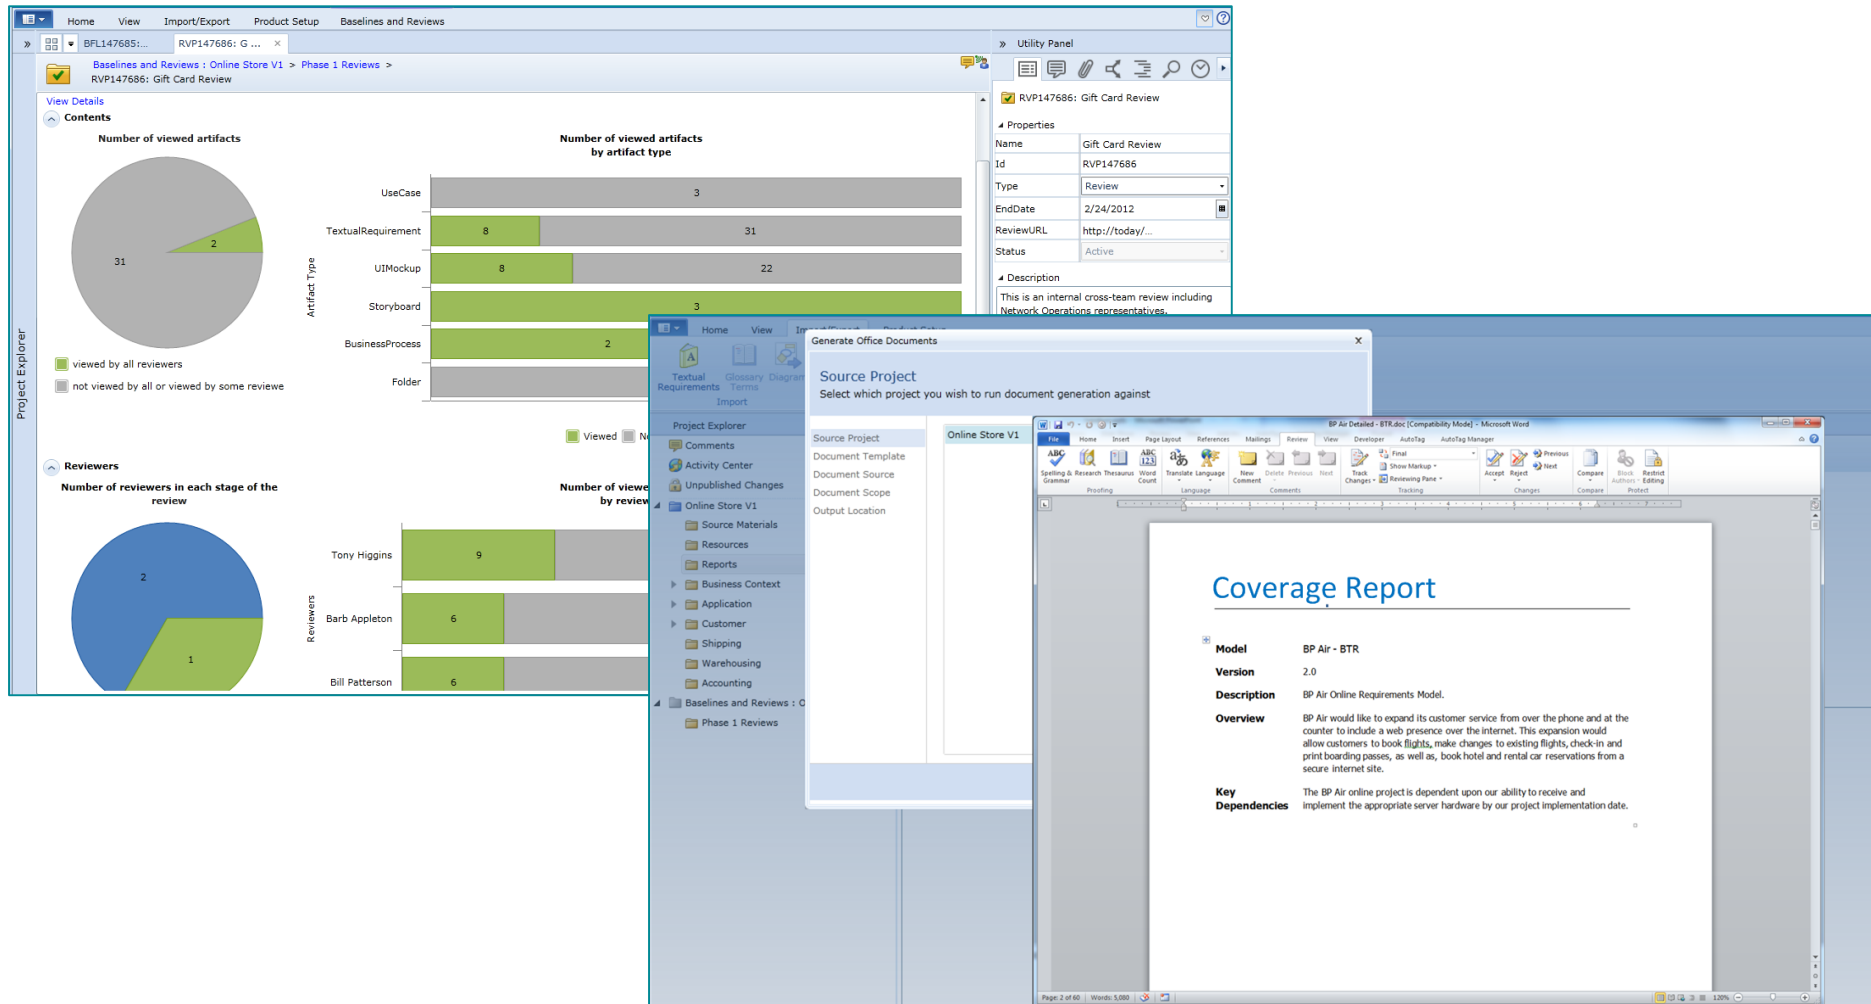

Misconception #4

Solution: Use fit-for-purpose methods for the decisions to be made:

- ✓ Focus on understanding the desired outcomes, which usually don't change
- ✓ Remember that the 'way we've always done it' is an activity developed for a time and may not be the correct activity in the current times.

Misconception #4

Misconception #5

Business Analysis is an
organizational drag

Misconception #5

Business Analysis involves critical, strategic thinking to understand business needs, not simply the ‘gathering’ of requirements.

Misconception #5

Business Analysis is an organizational drag.

- Business Analysis isn't simply the 'gathering' of requirements

In Enterprise Agile, BAs still need to answer critical questions such as:

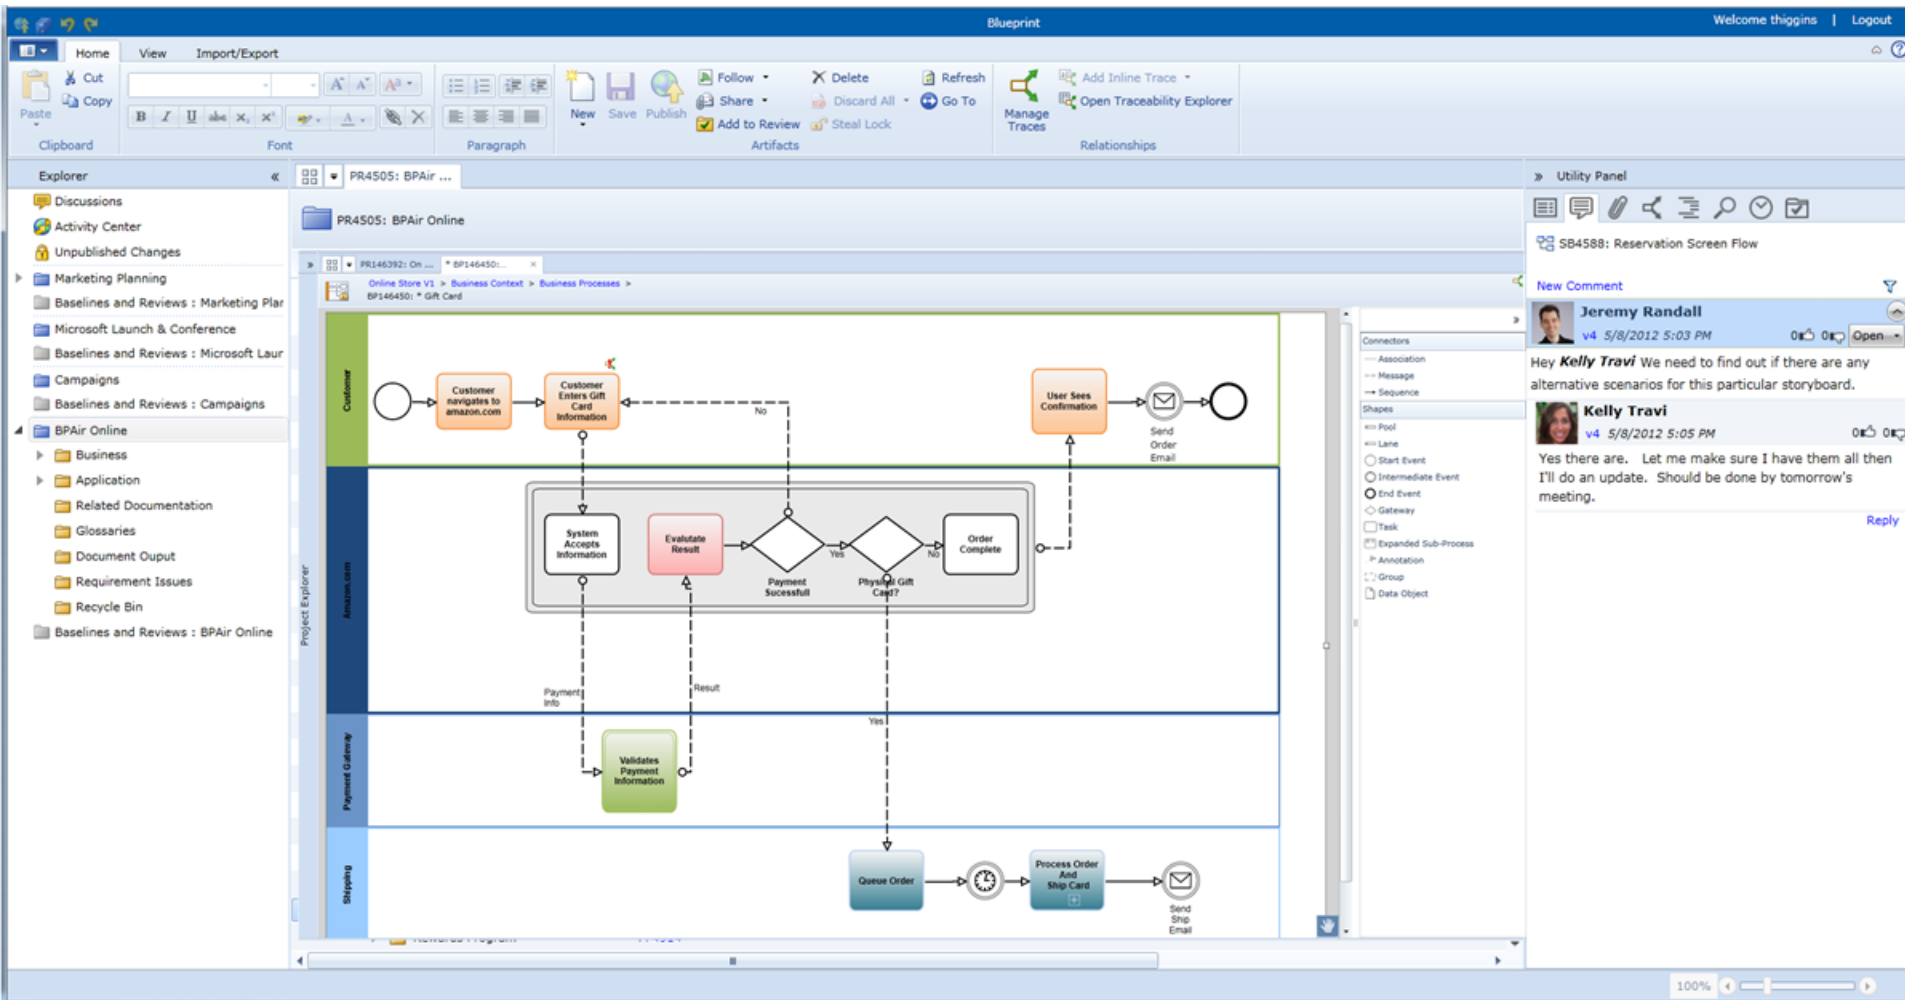

- What workflow should be automated and what should remain as is?
- What is the business case to support the application or new Investment Theme to be developed?
- What is the value to the business if we change this feature?
- What is the cost to the business if we don't deliver the plan?
- How can we improve the way the business operates by automating this task, and at what cost?
- How will the application be rolled out and supported?

Misconception #5

Solution: Equip your Business Analysts with a modern, purpose-built toolset:

- ✓ Allows BAs to fulfill their vital role within Enterprise Agile environments
- ✓ Adds to the efficiency that Agile is meant to deliver.

Blueprint: Highly visual, and with simulation

Misconception #6

Business applications can be understood
from code and tests alone

Misconception #6

Code and tests alone aren't helpful when it comes to understanding 'why' certain applications or components were implemented.

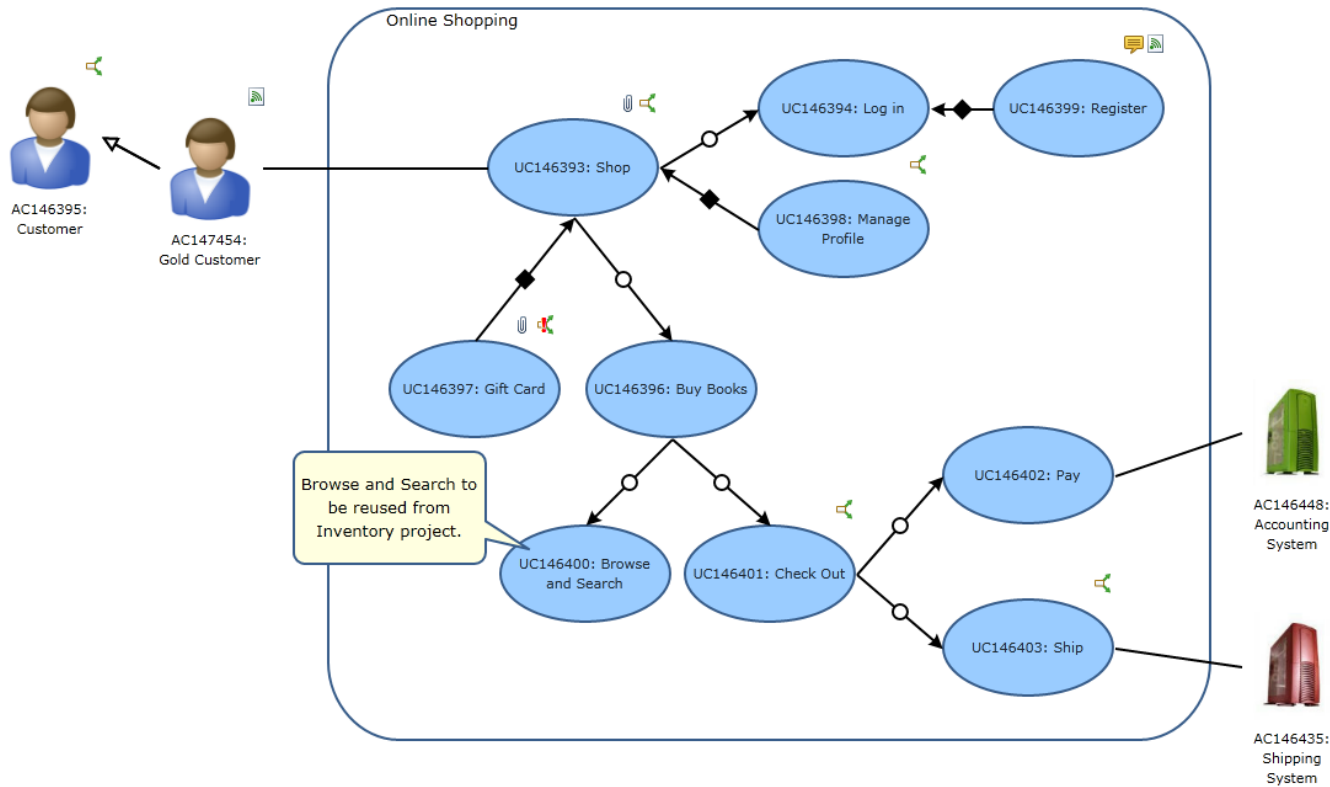

Misconception #6

Solution: Communicate in the language of the reader, not the writer:

- ✓ Abstract requirements to the level relevant to the recipient of the information
- ✓ Capture the levels of abstraction as they are discovered.

Misconception #6

Online Store V1 > Application >
UCD1: * Use Case Diagram

Misconception #7

Enterprise Agile will free you from
having to use requirements software

Misconception #7

In Agile, system requirements are defined during Sprint execution as part of the Conversation rather than up front.

Misconception #7

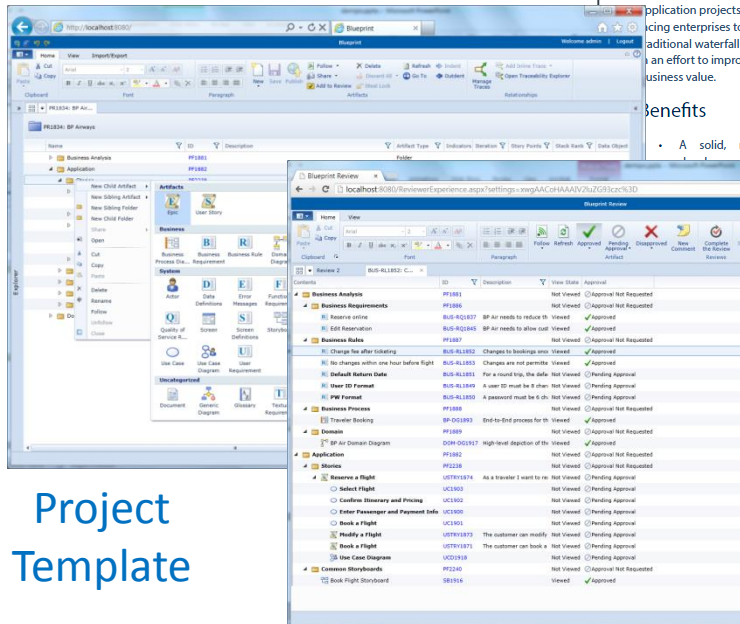

Solution: Look for a purpose-built requirements application configured specifically for Enterprise Agile environments:

- ✓ Collaborates with the Agile way of working
- ✓ Does not constrain and reduce Agile efficiencies.

Blueprint for Enterprise Agile

Overview

Blueprint for Enterprise Agile is a packaged solution that provides a solid foundation on which enterprises can employ agile practices on large, distributed, complex business application projects. It solves many of the fundamental issues facing enterprises today as they attempt the transition from additional waterfall-style processes to more agile approaches in an effort to improve project results and deliver predictable business value.

Solution Highlights

- Provides an approach to define project scope and establish business case to funding for agile projects
- Provides an approach that facilitates compliance audit for agile projects
- Automatic generation of requirements documents, entirely removing the burden of document authoring and maintenance
- Automatic generation of test scenarios from requirements to facilitate testing
- Expert mentoring and maximize return on investment

Benefits

- A solid, reliable, proven foundation for agile
